Abstract (Basic): WO 200036293 A

The arrangement has a transfer module (5) which forms an interaction between the (2) actuator and the control element (3), defining a pressure chamber (91) and balance chamber (92) at least partially filled with hydraulic medium and in mutual contact. The transfer module contains a piston element (51) and a holder element (52) which engage each other telescopically.

A pressure chamber is formed between the piston and holder elements, which are axially displaced with respect to each other by the actuator deflection from a rest position, in which the chamber connection is fully open, into a second position, in which the connection is essentially closed.

USE - For transferring actuator deflection to control element for diesel injection valve, especially common-rail system.

ADVANTAGE - High reliability and long operating life are achieved with damped transfer of actuator deflection.
